

#### 4. Which software process model is employed in the project and why. (Ch 2)

The software process model that utdClubs will use is the incremental method. We plan to use this model because it allows for the most flexible way in which we can complete the development of utdClubs. We believe this because it allows us to more easily adapt to changes in requirements, especially because we are not limited to any developmental barriers, as we are a small team of developers. It allows us to create software versions that align with our goals at a specific stage of development, while still allowing the ability to reiterate on previous ideas as specifications and requirements change. Additionally, it allows the utdClubs team to work closely together in the development process, which will then create a better final product.
